

1. Identifying a Challenge

This is a huge issue for women in tech because often we don't get the same opportunities. More often than no, we are not approached to do meaningful things or to work in leadership.

I will be launching small groups in dsc, where women help and encourage each other. we can have our female speakers to come in and talk about their stories, run workshops on how to be an effective leadership can be done single handedly by women. This will increase confidence and helps in preparing women to fight with challenges.

I have some ideas likewise I read in some article about the shadow program where female students would get to follow and learn about a female buddy in tech this could give them a real world exposure of how a woman can confidently work and speak in their domains.

And also I have heard of role reversal hackathons where girls would be the lead and men would be playing as supportive roles. These can also solve our problems in a efficient way.

2. Staying Updated

I stay in sync with the latest trends by following tech communities over linkedIn, Tech blogs and forums like WomenTechMakers. That helps me to keep in touch with the rest of women in tech and find events and programs some where I can participate. It keeps me inspired to keep playing and grow in knowledge.

3. Handling Gender Bias

My friend was once overlooked and ignored in a team meeting just because she happened to be the only lady in the group. After hearing that she felt his response personally attacked her, and cried about it for a while then told him the idea and that idea was really the most efficient of all the group members. Ultimately, of course her suggestion would be the one! This way, I learned that the confidence in me is one of most crucial quality you should never ever question yourself on even if others do.

4. Team Collaboration Experience

One of the team projects that we did was to develop a healthcare website for project exhibition. For serving older adults with its doctor-at-home services and through online healthcare, including a mental health chatbot. We shared the different roles for each of our specific skills and divided all tasks fairly, ensuring that everyone contributed to maintaining team flow. I maintained and organized an entire team in a dance

competition, we took home the gold! I learned that good teamwork requires listening, brainstorming ideas, and sticking with each other through the process.
